

Assignment 1 LLM Transcript

Bikash Bhowmik

LLM Transcript and Citation

Tool Used: ChatGPT (OpenAI, GPT-5)

Purpose: Debugging and improving reproducibility

Course: DATA 607 – Assignment 1

Conversation with ChatGPT (Datetime parsing using mutate + lubridate)

How should I convert created/closed date columns into datetime format?

Assistant (ChatGPT): Because NYC 311 datasets often contain timestamps in multiple formats,

using `as.POSIXct()` with a single format can fail or create missing values unexpectedly.

A more robust approach is using `lubridate::parse_date_time()` which can parse multiple possible formats.

Suggested code:

```
nyc_311_clean <- nyc_311_subset
```

```
# Convert date columns to datetime format
```

```
nyc_311_clean <- nyc_311_clean %>%
```

```
  mutate(
```

```
    created_date = parse_date_time(created_date, orders = c("mdy HMS p", "mdy HMS", "ymd HMS", "ymd HMSz")),
```

```
    closed_date = parse_date_time(closed_date, orders = c("mdy HMS p", "mdy HMS", "ymd HMS", "ymd HMSz"))
```

```
  )
```

```
# Rows after filtering missing created_date
```

```
nrow(nyc_311_subset)
```
